Project Description

- This Project is a console-based Java application that manages the core operations of Jewelry Store. The application is a lightweight

Package structure explanation

Package Descriptions

- employees: All employee-related classes and management logic
- jewelry: Jewelry hierarchy and inventory management
- customers: Customer entity and management
- orders: Order processing, order items, and status management
- payments: Payment processing and method handling
- utils: Utility classes, interfaces, and helper methods

- Main: Application entry point with user interface (console menu)

Key features implemented

1. Apply OOP Principles:
 - Design and implement class hierarchies using inheritance
 - Define and implement interfaces for common behaviors
 - Apply encapsulation and information hiding
 - Utilize generics for type-safe collections
2. Design Software Architecture:
 - Create well-structured package organization
 - Define clear relationships between entities (composition, aggregation, association)
 - Implement business logic with appropriate constraints
3. Implement Data Persistence:
 - Parse and generate CSV files
 - Manage data consistency across file operations
 - Handle file I/O exceptions appropriately
4. Utilize Java Collections:
 - Select appropriate collection types (ArrayList, HashMap, etc.)
 - Implement searching, filtering, and sorting operations
 - Manage object relationships through collections
